

## Create new structure

To create a new category click  
in the site structure overview which will take you to this form.

## Field descriptions

### Legende

#### Field Name

Structure Level Title

Alias of the structure level

#### Description

Decide here the title of the level.

Here you can decide the alias of the  
structure level, this will be needed for the  
direct call of the level.

Example:

`www.your_domain.tld/index.php?alias`

When you use Rewrite, also the page  
title will be created out of the alias.

Example: `www.your_domain.tld/  
alias.phtml`

Page title

You can also create a separate page title. It will then be shown in the title bar of the browser (only in article list mode available). You can define in your template under "Add title" what will be shown in the title bar.

redirect to:

Here you can redirect to an other structure or to external content.

Description of the structure level:

When you want to redirect to internal ~~Here you still can insert for other authors a description of the level. It is not visible for visitors of the site.~~

You can also create a separate description. It will then be shown in the meta description field in head area if there is no "description:" text available in "article basis information".

**Priority:** 1 Article basis information, 2. Site structure

Template:

**Notice:**

**If you have more the one article in a category (article list mode), the information from the site structure are used.**

Choose here what template shall be used for the new structure.

Here it is possible to choose an other template for the whole appearance of the site. There is the file

**"custom\_settings.php"** in "

Settings:

**template/inc\_settings/template\_default/**". This file contains the same values as the conf.template\_default.php, that you can find in the config folder of phpwcms.

**Notice:**

**Please notice that when you make changes to "custom\_settings.php" you should rename the file, because when you make an update the file could be overwritten.**

Here you can say, how many articles with summary shall be shown on the page. The standard is "-1" and means that all articles with summary will be shown in this level.

Top article count:

If you want to use the pagination, you need to add the number of articles that you want to add into this structure. If you let the "-1" as value the pagination will not work.

It is possible to paginate one or more articles to more pages.

Pagination:

According to the value that you insert into the field "articles per page" you can decide, how many articles per page will be shown.

Here you can decide, with which sorting the article with summary will be shown.

The following settings are possible:

**manually (Arrow up/down)**

**Date of creation**

**Date of change**

**Start date**

**End date**

**Article title**

**Furthermore you can define the sequence by choosing**

**ascending**

**descending .**

Here you have the possibility, to decide as administrator what content Parts are available in this level. When you don't choose anything, all content parts will be shown.

Content Part Selection:

Choose the corresponding content part in the left window and add it with . To delete it press .

Frontend menu status

Next ... [Move level](#) <sup>^TOP</sup>

URL: [http://www.phpwcms-docu.de/index.php?create\\_level](http://www.phpwcms-docu.de/index.php?create_level)

Here you have two choices:

**invisible:** By checking this setting, this structure will not be shown for visitors

**visible, if active:**

**visible only for logged users:** Not functional at this time

By checking this setting this page will not be included in the cache function. Otherwise you can define, after what time the page will be rewritten into the cache. Possible values are: 1min to 1 month.

Here you can define, whether the article content shall be included in the search.

The standard is, that the content can be found. By checking this function the content will be excluded in the search.

For making the structure visible for visitors, please check **visible** and **public**

For using SSL you need an SSL certificate. When you already have a certificate, please change to needed entries in (config/phpwcms/)

**conf.inc.php** in item "// **dynamic ssl encryption engine**"
